Client Technology

The NewsWay X client has been designed utilizing the latest browser technology - HTML5, without any reliance on Java.

The HTML5 browser client provides full access to the system and the integrated interface enables all the departments to track and manage production.
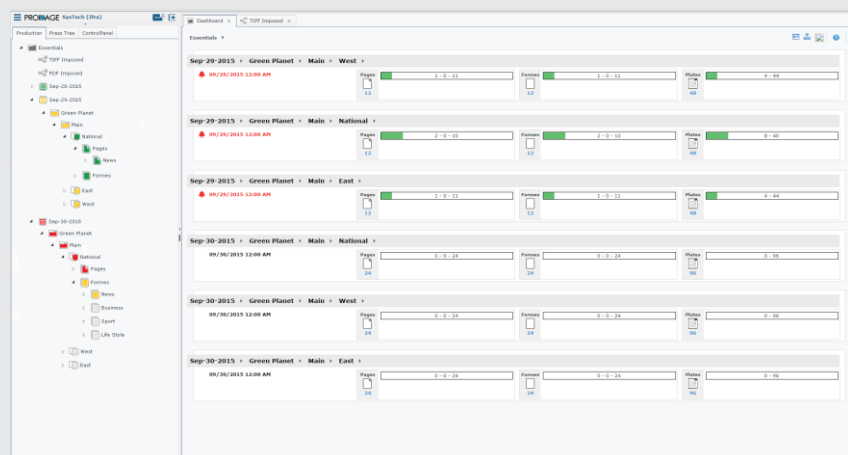

According to their privileges, the users can view the production progress, workflow steps, pages, or plates, and perform a variety of operations required to manage production.
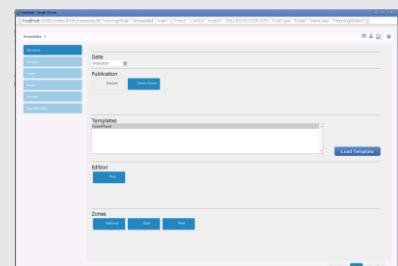

Job Tracking

The NewsWay X platform provides highly sophisticated job tracking capabilities.

The system displays the production status in a layered approach, from very general production views to the status of a single file or plate.

All the operations in the system and user activity are logged.

Planning Tools

The system provides integrated production planning and imposition tools. Automatic planning is made possible by the interfacing to the Editorial, Advertising and Press Control systems. The integration with the Editorial and Press Control Systems eliminates possible human errors.

NewsWay X

Available integrated components:

CTP – Output to all available CTP devices

NW RIP – Based on Global Graphics Harlequin RIP

OnColor – Image enhancement and optimization

OnColor ECO – Provides ink saving and faster setup

PitStop Server – PDF Preflight checking

PitStop Pro – PDF File Editing

Ink Presetting – Interface with most Press Control Systems

ICC profiled SoftProof – Provides console proofing

Cloud Ready

NewsWay X has been designed as a cloud-ready system, providing a multitenant architecture on a single platform. The HTML5 interface ensures fast access to and control of all the system resources. Each individual environment in the multitenant architecture has its own security, permissions and privileges.

Contract Printing

NewsWay X has specialized tools which allow the printer to maximize revenue through contract printing. NewsWay Shuttle, a special branded portal for external customers, allows them to upload files, submit them to the production plan, and approve them for production in a seamless and efficient manner.

NewsWayX Workflow

Flexibility and scalability

We have provided a highly flexible solution where workflows can be designed using a simple drag-and-drop operation. This allows the system to meet any publisher's and printer's requirement by tailoring it to their needs.

The utilized technology provides full scalability. A basic system can start with a single server and when the production load grows, additional servers can be added as computing resources to share the increased load. No changes to the existing workflows are needed, thus making the entire process transparent to production.

Enterprise system

NewsWay X can provide multi-site production. The central site communicates with the remote sites, which can be users of NewsWay systems, or contract printers with third-party workflow solutions. The system provides detailed tracking and status information regarding the files transmitted to the remote sites.

Integration

NewsWay X seamlessly integrates with software components within an enterprise, to provide additional value in production. Other components belonging to ProImage or third-party providers appear to the user as additional workflow steps in the system.
